

## GUI vs CLI

Both the GUI and CLI are two interfaces that are enabled by the operating system, some of which are Windows, Linux, IOS and Android, to name a few. Although, that doesn't mean they're identical. The GUI, for example, seems to be more of a visual based interface, where the user has images and icons. Whereas the CLI uses commands, like text. When it comes to which is easier to learn and use, the GUI is the winner. It provides instant visual feedback. The CLI seems to require more memorization and familiarization from the user, making it the more difficult of the two options to learn. However, it seems with it having a higher degree of difficulty, it does provide superior results when it comes to multitasking, speed and control. The GUI also requires a large amount of storage space. It goes without saying that both are important, but have specific uses for different people.
